

User Flow Document

Every journey through Raj Raani Collections — shopper, returning customer, and the owner running the store — from first landing to order delivered.

Brand	Raj Raani Collections
Companion to	Lehenga Commerce Blueprint
Covers	Guest & customer journeys, auth, admin operations, AI assistant, custom orders

01

How to read this document

Each flow below is a straight-line path down the page: a box is a screen or action, an arrow is what happens next, and a tan branch note marks a decision point where the path splits. These are the journeys the storefront and admin panel need to support — build toward them, and test against them before launch.

02

Who uses the site

PERSONA	WHAT THEY WANT	WHERE THEY LAND
Guest shopper	Browse and buy without committing to an account	Home → Shop → Product → Guest checkout
Registered customer	Faster repeat purchases, order history, saved addresses	Login → Account → reorder
Bridal / custom buyer	A made-to-measure piece, needs a conversation before paying	Custom category → enquiry → WhatsApp
Store owner (admin)	Run the shop day-to-day without a developer	/admin — inventory, orders, assistant review

03

Core purchase flow — guest shopper

The path most revenue travels through. No account is required at any step.

1. Land on **Home** — hero, featured pieces, shop-by-category, WhatsApp CTA visible throughout.
2. **Shop** or a **Category** page — filter by price/size/color/fabric, or arrive directly from a category link.
3. **Product** page — pick size and color (scoped to real stock), check the size chart tab, enter a pincode to see "Delivers in 1–2 days" (NCR) or "3–7 days" (elsewhere), add to cart.
4. **Cart** — review quantities, see the free-delivery progress bar, proceed to checkout.
5. **Checkout** — one page: address (new or, if logged in, saved) → delivery method is auto-set by pincode → payment method.
6. Pay via **Razorpay** (UPI/card/netbanking) or select **Cash on Delivery**.
7. **Confirmation** page, plus an automatic WhatsApp/SMS receipt. A prompt offers account creation — "track this order any time."
8. Return later via **/track-order** with the order number and phone to see live Shiprocket status, no login needed.

If payment fails

The checkout page shows the error inline with a retry button — never a dead-end page. The order stays in a Pending state until payment succeeds or the customer abandons it.

If out of stock

The variant selector disables that size/color combination the moment stock hits zero — never lets a customer purchase what isn't there.

04

Account creation & sign-in

New account

1. From **/register**, choose email+password or phone — phone is expected to be the more common path for Indian shoppers.
2. Phone path: enter the number, Firebase sends an OTP by SMS, the code is entered inline (no separate page).
3. On success, a profile document is created and any guest cart in the browser merges into the account automatically.

Returning customer

Forgot password

One page, two states: request a reset link by email, then — arriving back via that link's token — set a new password on the same route.

05

Store owner — a typical day

This is the loop an owner runs without ever opening code or asking a developer for help.

1. Sign in at the same **/login** customers use — the account simply carries the admin claim, landing on **/admin**.
2. **Dashboard** shows today's orders, pending count, and any product at or below its low-stock threshold.
3. **/admin/inventory** — the spreadsheet view. Click a stock cell after a physical count, or import a bulk-edited Excel file after a big restock.
4. **/admin/orders** — filter to "New," confirm each, and either book a Shiprocket pickup or (early on) book Delhi NCR delivery manually through Shiprocket Quick or Porter's own app.

5. Move each order through **Confirmed** → **Processing** → **Shipped** as it physically happens; Shiprocket's webhook takes over from Shipped to Delivered automatically once the API is wired up.
6. Check **/admin/assistant** periodically to see what the AI has been telling customers, and step in on WhatsApp wherever it escalated.

New category

Add it once in **/admin/categories** — its storefront page and nav entry appear immediately, no deploy.

06

AI shopping assistant conversation

1. Customer opens the chat widget and asks a real question — sizing, fabric, "something in maroon under Rs. 20,000."
2. The server route matches the message against real products in Firestore before calling Claude.
3. Claude answers using only that matched catalog data and the store's policies — brand voice fixed by a system prompt, India-only delivery stated if asked.
4. If the question is answered, the conversation continues. If not, the assistant hands off to WhatsApp rather than guessing.

07

Custom / made-to-measure enquiry

Bridal and made-to-order pieces need a conversation before a card is charged — this path is deliberately slower and more human than the standard checkout.

1. Customer browses the **Custom / Made-to-Measure** category and opens a piece marked `isCustomizable`.
2. An enquiry section on that same product page (not a separate route) collects measurements, occasion date, and opens WhatsApp with the details pre-filled.
3. The owner discusses fit and finish directly, quotes a final price and lead time.
4. A partial advance is collected (via a Razorpay payment link, or COD-style in person) before production starts.
5. The product's `leadTimeDays` sets expectations; the order stays in **Processing** until the piece is actually ready to ship.
